Andrew ID (print clearly!):	
Full Name:	

15-213/18-213, Fall 2012

Final Exam

Monday, December 10, 2012

Instructions:

- Make sure that your exam is not missing any sheets, then write your Andrew ID and full name on the front.
- This exam is closed book, closed notes (except for 2 double-sided note sheets). You may not use any electronic devices.
- Write Ar Siswes in the specific provided by the John Mr Adinak a ness, pearly indicate your final answer.
- The exam has a maximum score of 98 points.
 The problems are problems are problems indicated. Good luck!

Problem 1. (18 points):

Multiple choice questions on a variety of stimulating and refreshing topics.

To receive credit, you must write your answer for each question in the following table:

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	-	-

- 1. Each thread has its own _____.
 - (a) Heap
 - (b) Stack
 - (c) Global values
 - (d) Text data
- 2. Simply decreasing the size of block headers used internally by malloc:
 - (a) Designment Project Exam Help
 - (b) Increases internal fragmentation
- 3. Which of the following sentences about reader-writer locks is not true?
 - (a) Many readers can hold the same rwlock at the same time
 - (b) Two writers cannot hold the same rwlock at the same time
 - (c) Many readers and exactly one writer can hold the same rwlock at the same time
 - (d) An rwlock can be used as a mutex
- 4. Which of the following is the correct ordering (left-to-right) of a file's compilation cycle (a filename with no extension is an executable):
 - (a) foo.c \rightarrow foo.o \rightarrow foo.s \rightarrow foo
 - (b) $foo \rightarrow foo.s \rightarrow foo.o \rightarrow foo.c$
 - (c) foo.c \rightarrow foo.s \rightarrow foo \rightarrow foo.o
 - (d) foo.c \rightarrow foo.s \rightarrow foo.o \rightarrow foo

- 5. Suppose an int A is stored at virtual address 0xff987cf0, while another int B is stored at virtual address 0xff987d98. If the size of a page is 0x1000 bytes, then A's physical address is numerically less than B's physical address.
 - (a) Always true
 - (b) Always false
 - (c) Sometimes true, sometimes false
 - (d) Not enough information
- 6. Assuming no errors, which one of the following functions returns exactly once?
 - (a) fork()
 - (b) execve()
 - (c) exit()
 - (d) longjmp()
 - (e) waitpid()
- 7. On a 64-bit system, which of the following C expressions is equivalent to the C expression (x[2] + 4)[3]? Assume x is declared as int **x.

Assignment Project Exam Help

- (b) $\star ((\star (x + 2)) + 7)$
- $\underset{(d)}{\overset{(c)}{\star}} * (((\star x) + 2) \underbrace{\text{https://powcoder.com}}_{7)}$
- (e) (**(x + 2) + 7)
- 8. When can short courts ded. We Chat powcoder
 - (a) When an EOF is encountered during a read
 - (b) When a short, int is used as a counter
 - (c) When reading or writing to disk files
 - (d) When the kernel runs out of kernel memory

(more)

- 9. A program blocks SIGCHLD and SIGUSR1. It is then sent a SIGCHLD, a SIGUSR1, and another SIGCHLD, in that order. What signals does the program receive after it unblocks both of those signals (you may assume the program does not receive any more signals after)?
 - (a) None, since the signals were blocked they are all discarded.
 - (b) Just a single SIGCHLD, since all subsequent signals are discarded.
 - (c) Just a single SIGCHLD and a single SIGUSR1, since the extra SIGCHLD is discarded.
 - (d) All 3 signals, since no signals are discarded.
- 10. Which of the following events does not generate a signal?
 - (a) Division by zero
 - (b) A new connection arrives on a listening socket
 - (c) A write is attempted on a disconnected socket
 - (d) NULL is dereferenced
 - (e) A process whose parent has already terminated exits
- 11. In an x86-64 system, how many integers can be stored in a cache line if your cache is 4KB, is 4-way set-associative, and contains 4 sets?
 - Assignment Project Exam Help
 - (b) 16
 - (c) 32 (d) 64 https://powcoder.com
 - . ,
 - (e) 128
- 12. Which types of local to the every entire that the every entire the every entire that the every entire that
 - (a) Spatial locality
 - (b) Temporal locality
 - (c) Prime locality
 - (d) Both (a) and (b)
 - (e) Both (b) and (c)
- 13. Which of the following is not a section of an ELF file?
 - (a) .text
 - (b) .static
 - (c) .rodata
 - (d) .data
 - (e) .bss

(more)

- 14. Choose the true statement.
 - (a) All thread-safe functions are reentrant.
 - (b) Some reentrant functions are not thread safe.
 - (c) It is never a good idea to use persistent state across multiple function calls.
 - (d) It is impossible to have a race condition between two threads as long as they have no shared state.
 - (e) All functions which call non-thread-safe functions are themselves not thread safe.
- 15. We use dynamic memory because:
 - (a) The heap is significantly faster than the stack.
 - (b) The stack is prone to corruption from buffer overflows.
 - (c) Storing data on the stack requires knowing the size of that data at compile time.
 - (d) None of the above.
- 16. In the following code, a parent opens a file twice, then the child reads a character:

```
char c;
int fd1 = open("foo.txt", O_RDONLY);
int faces parament Project Exam Help
if (!fork()) {
    read(fd1, &c, 1);
}
```

Clearly, in the child the Swip on Prohive Coolee For Connect. Which of the following is now true in the parent?

- (a) fd1 and fd2 Aoth point whe fir Character DOWCOder
- (b) fd1 and fd2 both point to the second character
- (c) fd1 points to the first character while fd2 points to the second character.
- (d) fd2 points to the first character while fd1 points to the second character.
- 17. Which of the following is true about races?
 - (a) A race occurs when correctness of the program depends on one thread reaching point a before another thread reaches point b.
 - (b) Exclusive access to all shared resources eliminates race conditions.
 - (c) Race conditions are the same as deadlocks.
 - (d) All race conditions occur inside loops, since that is the only way we can interleave processes.

(more)

18. Consider the following two blocks of code, which are contained in separate files:

```
/* main.c */
int i = 0;
int main() {
   foo();
   return 0;
}

/* foo.c */
int i = 1;
void foo() {
    printf("%d", i);
}
```

What will happen when you attempt to compile, link, and run this code?

- (a) It will fail to compile.
- (b) It will fail to link.
- (c) It will raise a segmentation fault.
- (d) It will print "0".
- (e) It will print "1".
- (f) It will sometimes print "0" and sometimes print "1".

Problem 2. (6 points):

Floating point encoding. In this problem, you will work with floating point numbers based on the IEEE floating point format. We consider two different 6-bit formats:

Format A:

- There is one sign bit s.
- There are k=3 exponent bits. The bias is $2^{k-1}-1=3$.
- There are n=2 fraction bits.

Format B:

- There is one sign bit s.
- There are k=2 exponent bits. The bias is $2^{k-1}-1=1$.
- There are n=3 fraction bits.

For formats And S bease with down the bilary representation for deficient for denormalized numbers, E=1 – bias. For normalized numbers, E=e – bias.

Problem 3. (6 points):

Arrays. Consider the C code below, where H and J are constants declared with #define.

```
int array1[H][J];
int array2[J][H];

void copy_array(int x, int y) {
    array2[x][y] = array1[y][x];
}
```

Suppose the above C code generates the following x86-64 assembly code:

```
# On entry:
   edi = x
   esi = y
copy_array:
   movslq %esi, %rsi
   movslq %edi, %rdi
   movq Assignment Project Exam Help
        %rdi, %rax
   subq
   addq
         %rsi, %rax
         (%rshttps://powcoder.com
   leaq
   leaq
         array1(,%rsi,4), %edx
   movl
         *edx, Aartay2 WeChat powcoder
   movl
```

What are the values of H and J?

H =

Problem 4. (8 points):

Loops. Consider the following x86-64 assembly function:

```
# on entry: a in %rdi, n in %esi
   movl $0, %r8d
          $0, %ecx
   movl
   testl %esi, %esi
    jle .L3
.L6:
   movl (%rdi,%rcx,4), %edx
leal 3(%rdx), %eax
   testl %edx, %edx
   cmovns %edx, %eax
   sarl $2, %eax
   addl %eax, %r8d
   addq $1, %rcx cmpl %ecx, %esi
   jg .L6
.L3:
   movl %r8d, %eax
   ret
```

Fill in the blanks of this grant tent of Project Exam Help

- You may only use the C variable names n, a, i and sum, not register names.
- Use array notation in showing accesses or updates to elements of a ntups://powcoder.com

```
int loop(int a[], int n)
{
    int i, sum;
    Add WeChat powcoder
    sum = ____;
    for (i = _____; ____; ____) {
        sum += ____;
    }
    return ____;
}
```

Problem 5. (10 points):

Stack discipline. Consider the following C code and its corresponding 32-bit x86 machine code. Please complete the stack diagram on the following page.

```
int fact(int n) {
    if (n == 1)
        return n;
    else
        return n * fact(n-1);
}
080483a4 <fact>:

A. Draw a detailed picture of the stack, starting with the caller invoking fact (4), and ending immediately **before** the call instruction that invokes fact (2).

- The stack diagram should begin with the argument for fact that the caller has placed on the stack. To help you get started, we have given you the first one.
- Use the actual values for function arguments, rather than variable names. For example, use 3 or 2 instead of n.
- For callee-saved registers that are pushed to the stack, simply note the register name (e.g, %ebx).
- Always label %ebp and give its value when it is pushed to the stack, e.g., old %ebp: 0xffff1400.

Value of %ebp when fact(4) is called: 0xffffd848 Return address in function that called fact(4): 0x080483e6 Stack The diagram starts with the addresss argument for fact (4) 0xffffd830 | 4 | 0xffffd82**Assignment Project Exam Help** 0xffffd828 | 0xffffd824 | 0xffffd820 | 0xffffd81c | 0xffffd818 | 0xffffd814 | 0xffffd810 | **B.** What is the final value of %ebp, immediately **before** execution of the instruction that calls fact (2)? %ebp=0x_____ C. What is the final value of %esp, immediately **before** execution of the instruction that calls fact (2)? %esp=0x

Problem 6. (12 points):

Cache memories. Consider the following matrix transpose function

```
typedef int array[2][2];

void transpose(array dst, array src) {
  int i, j;

for (j = 0; j < 2; j++) {
   for (i = 0; i < 2; i++) {
     dst[i][j] = src[j][i];
   }
  }
}</pre>
```

running on a hypothetical machine with the following properties:

- sizeof(int) == 4.
- The src array starts at address 0 and the dst array starts at address 16 (decimal).
- There is a single L1 data cache that is direct mapped and write-allocate, with a block size of 8 bytes.
- Accesses to the see and dst arrays are the only sources of read and write accesses to the cache, respectively.
- A. Suppose the cache has a total size of 6 day byes (in the total life times the number of sets is 16 bytes) and that the cache is initially empty. Then for each row and col, indicate whether each access to src[row] [col] and dst[row] [col] is a hit (h) or a miss (m). For example, reading src[0][0] is a miss and writing dst [0][0] is also a miss.

		AUI
:	src array	1
	col 0	col 1
row 0	m	
row 1		

' -													
dst array													
	col 0	col 1											
row 0	m												
row 1													

B. Repeat part A for a cache with a total size of 32 data bytes.

src array										
	col 0 col 1									
row 0	m									
row 1										

dst array										
	col 0									
row 0	m									
row 1										

Problem 7. (6 points):

Linking. Consider the executable object file a.out, which is compiled and linked using the command

```
unix> gcc -o a.out main.c foo.c
```

and where the files main.c and foo.c consist of the following code:

What is the output of a https://powcoder.com

Answer: a=____, b=____, c=____

Add WeChat powcoder

Problem 8. (10 points):

Exceptional control flow. Consider the following C program. (For space reasons, we are not checking error return codes, so assume that all functions return normally.)

```
int main()
   int val = 2;
   printf("%d", 0);
   fflush(stdout);
   if (fork() == 0) {
      val++;
      printf("%d", val);
       fflush(stdout);
   }
   else {
       val--;
       printf("%d", val);
      Assignment Project Exam Help
   }
   val++;
   printf("%d", https://powcoder.com
   exit(0);
}
```

Add WeChat powcoder

For each of the following strings, circle whether (Y) or not (N) this string is a possible output of the program. You will be graded on each sub-problem as follows:

- If you circle no answer, you get 0 points.
- If you circle the right answer, you get 2 points.
- If you circle the wrong answer, you get -1 points (so don't just guess wildly).

A.	01432	Y	N
B.	01342	Y	N
C.	03142	Y	N
D.	01234	Y	N
E.	03412	Y	N

Problem 9. (12 points):

Address translation. This problem concerns the way virtual addresses are translated into physical addresses. Imagine a system has the following parameters:

- Virtual addresses are 20 bits wide.
- Physical addresses are 18 bits wide.
- The page size is 1024 bytes.
- The TLB is 2-way set associative with 16 total entries.

The contents of the TLB and the first 32 entries of the page table are shown as follows. **All numbers are given in hexadecimal**.

		TL	LB			Page Table							
	Index	Tag	PPN	Valid		VPN	PPN	Valid	VPN	PPN	Valid

Problem 10. (10 points):

Concurrency, races, and synchronization. Consider a simple concurrent program with the following specification: The main thread creates two peer threads, passing each peer thread a unique integer thread ID (either 0 or 1), and then waits for each thread to terminate. Each peer thread prints its thread ID and then terminates.

Each of the following programs attempts to implement this specification. However, some are incorrect because they contain a race on the value of myid that makes it possible for one or more peer threads to print an incorrect thread ID. Except for the race, each program is otherwise correct.

You are to indicate whether or not each of the following programs contains such a race on the value of myid. You will be graded on each subproblem as follows:

- If you circle no answer, you get 0 points.
- If you circle the right answer, you get 2 points.
- If you circle the wrong answer, you get -1 points (so don't just guess wildly).
- A. Does the following program contain a race on the value of myid? Yes No

```
Assignment Project Exam Help
```

```
myid = *((int *)vargp);
Free(vargp);
printf("Thteps://powcoder.com)}
```
